WEBINAR DESCRIPTION

This special webinar is designed to educate patients about relapsed/refractory multiple myeloma (MM), a cancer of plasma cells of the bone marrow that has recurred after treatment (relapsed) or that has progressed during or not responded to treatment (refractory). Participants will learn what is important in a diagnosis of relapsed/refractory disease, what therapeutic options are available and what side effects may be encountered. Led by nationally renowned medical oncologist Dr Neil Love, this medical webinar is designed to provide accessible information for patients with relapsed/refractory MM and their friends or family members.

ASK THE FACULTY

Submit your own questions for the faculty to address during the live webcast.

KEY TAKEAWAYS

- Recognize signs and symptoms of multiple myeloma and underlying causes of disease recurrence
- Identify important elements in the diagnosis of refractory versus relapsed multiple myeloma
- Learn about available treatment options and considerations
- Understand side effects and how they are treated
- Contribute to shared decision-making between patients and their healthcare providers
